Forthiscase, thefreestream Machnumberis 0. 5, theReynoldsnumberbasedonthechordis 4. 5million, andtheincidence is 2. 8 degreesA. t theseconditionst, he flow is supercriticala, nda shockis formedon the uppersurfaceof the slat, ascanbe seenfrom thefigure. Thecomputedshockis somewhat diffuse, andanincreasedmeshresolutionin this regionwouldberequiredto obtaina crisper shockdefinition. However, the sudden thickening of the boundary layer as it interacts with the shock is evident from the computed Mach contours. A small recirculation region is also observed on the lower surface of the slat. A comparison of the computed surface pressure distribution with the experimentawl ind tunnel data is given in Figure15. Computed and experimental values are seen to agree favorably in all regionsd, emonstrating a good prediction of the suction peaksa, nd location of the slat upper surface shock. This solution required roughly eight cp minutes on a single processor or a Cray-2 supercomputer, hich corresponds to 75 multigrid cycles on the finest grid, during which the residuals were reduced by approximately three orders of magnitude. To the authors' knowledge, this represents the first compressible turbulent flow calculation for multi-element airfoil geometries using unstructured meshes. 8. CONCLUSION A method for solving viscous and inviscid flows about arbitrary two-dimensional configurations has been presented. An attempt has been made to keep the method as general as possible. The simultaneous use of multigrid and adaptive meshing. . . This item ships from La Vergne, TN. Paperback.
